GOLDENSTORE - CREDIT MODULE

# Returnables

# Add - Return - Processing

How Chopines, Bouteilles and Caisses are counted, displayed and removed

## What this document covers

This review pack explains the complete returnable-items lifecycle in the credit module: how items enter the system when a transaction is recorded, how the balance is derived from transaction text, how brands and quantities are matched, how items are returned from the client detail and action screens, and how payments and settlements interact with the balance.

Prepared: 29 October 2026 - Status: implementation reference for review

**KEY IDEA**
No returnable quantity is stored anywhere. Every number shown in the UI is recomputed from the text of the client's credit transactions: additions come from normal debt transactions, reductions come from transactions whose description contains "Returned:". Change or delete a transaction and the returnable balance changes immediately.

### Source files used for this document

| File | Role in the returnables flow |
|---|---|
| **src/utils/returnableItemsUtils.ts** | Parsing of descriptions, brand handling, running balance calculation |
| **src/components/ClientSearchModal.tsx** | Add-to-client form, quick actions, returnable brand helper popup, comma validation |
| **src/components/ClientDetailModal.tsx** | Returnable Items panel, per-item return stepper, Clear All |
| **src/components/ClientActionModal.tsx** | Return processing from the action sheet, settle summaries, legacy bottles display |
| **src/components/ClientCard.tsx** | Grid card display of outstanding items with date/time flip |
| **src/context/CreditContext.tsx** | Transaction storage, payments, settle flows, legacy returnBottles |
| **src/components/CreditManagement.tsx** | Amount validation, active/returnables filters, success card |

# 1. The mental model

Returnables are a ledger, not a stock table. The system keeps a list of credit transactions per client; each transaction has a description, an amount, a date and a type ("debt" or "payment" is implied by the flow). Returnables are derived by reading those descriptions in date order.

- Additions: a debt transaction whose description mentions Chopine, Bouteille or Caisse contributes its quantity to the balance.
- Reductions: a transaction whose description contains "returned" contributes negative quantities, matched per item type and brand.
- Balance: remaining = added - returned, per type + brand key. Items with remaining <= 0 are not shown.
- Payments (type "payment") are ignored completely by the returnables calculator.

## Two parallel concepts exist

| Concept | What it is | Where it lives |
|---|---|---|
| **Parsed returnables (primary)** | Chopine / Bouteille / Caisse balances with optional brand, derived from transaction descriptions | Always recomputed from the transactions store |
| **Legacy bottlesOwed counters** | Five fixed counters per client: beer, guinness, malta, coca, chopines. Shown as "Bottles owed" badges | Stored on the client record; changed only by returnBottles and full-clear settlement |

The two systems are not connected: returning parsed bottles (Returned: transactions) does not decrement bottlesOwed, and the legacy counters do not influence the Returnable Items panel. Only a full-clear settlement resets bottlesOwed.

# 2. Adding returnables (item taken)

Returnables enter through the same form that records any transaction: the calculator amount goes to "Add to Client", then ClientSearchModal collects the description.

## 2.1 Step by step

- Enter the amount on the main calculator and press Add to Client.
- Choose an existing client or type a new client name; the description field appears.
- Type the description manually or use Quick Actions to append item templates.
- Pressing the confirm action validates the input, then addTransaction() stores the transaction and increases the client debt.
- The client card immediately shows the new returnable wording, and the balance is recomputed on the next render.

## 2.2 Quick Actions and the number pad

Quick Actions append text to the description, comma-separated. If a pending number was typed on the custom number pad, it is prefixed to the action; returnable actions default to "1 " when no number is pending.

| Quick Action | Result inserted into the description |
|---|---|
| **Chopine / Bouteille / Caisse** | "1 Chopine", "1 Bouteille", "1 Caisse" (default quantity) |
| **Bouteille 1L / 1.5L, Caisse (Bt) / (Ch) / (Lt)** | Type with size or subtype, prefixed by the pending number when present |
| **Non-returnable actions (Foodstuffs, Cig, Rum, Can, Soft Drinks, Cakes, Juice Payment)** | Inserted as-is with no default quantity |

## 2.3 Returnable brand helper popup

When the description contains a returnable keyword, a yellow "Available Returnables" panel appears above the input. It is a recall aid: it suggests brands the client still has outstanding for the exact type being typed.

- Detection: runs 300 ms after typing stops, scanning the whole description for the LAST occurrence of chopine(s), bouteille(s) or caisse(s).
- Type matching is exact, including subtype and size: "Bouteille" does not suggest "1L" bottles; "Caisse (Bt) 1L" only matches that exact variant.
- Optional brand filter: text after the type, subtype and size narrows the suggestions by brand prefix.
- Brands already typed in the current comma segment are excluded, so the same brand can be re-added in a later segment.
- Maximum five suggestions. Clicking one appends only the brand word to the description (no quantity, no type).

## 2.4 Input rules enforced by the form

| Rule | Behaviour |
|---|---|
| **Description required** | A transaction cannot be saved without a description |
| **Amount rule** | Amount must be > 0, OR the description must contain Chopine, Bouteille or Caisse - a zero-rupee delivery of returnables is allowed |
| **Comma rule** | Two returnable keywords in the same segment are rejected with: Please separate returnable items with a comma. A comma followed by a new item is normalised to ", " |
| **Capitalisation** | Typed words are title-cased as they are entered, except digits/size handling |

# 3. Parsing rules: quantity, type, brand

The parser (parseReturnableSegment / extractReturnableItems) is intentionally simple and works per comma segment.

## 3.1 The five-step rule

```
1. Split the description on commas.
2. In each segment, find the first matching keyword (case-insensitive):
   chopines? / bouteilles? / caisses?
3. Quantity = first integer found BEFORE the keyword. Default = 1.
4. Brand = everything AFTER the keyword, trimmed.
5. Key = "<Type> <brand lowercased>" or "<Type>" when there is no brand.
```

Only one item is parsed per segment, and the keyword priority is Chopine, then Bouteille, then Caisse if several appear in the same segment. Repeated keys across segments are summed.

## 3.2 Worked parsing examples

| Description segment | Qty | Key (normalised) | Displayed as |
|---|---|---|---|
| **2 Bouteille 1L Coca** | 2 | Bouteille 1l coca | 2 Bouteilles 1L Coca |
| **3 chopines beer** | 3 | Chopine beer | 3 Chopines beer |
| **Bouteille** | 1 | Bouteille | 1 Bouteille |
| **5 Bouteilles 1.5L** | 5 | Bouteille 1.5l | 5 Bouteilles 1.5L |
| **1 Caisse (Bt) Coca** | 1 | Caisse (bt) coca | 1 Caisse (Bt) Coca |
| **7seas chopine** | 7 | Chopine seas | 7 Chopines seas (see note) |
| **Caisse (Ch)** | 1 | Caisse (ch) | 1 Caisse (Ch) |

**WATCH THE KEYWORD POSITION**
Quantity is only read from text BEFORE the keyword. "7seas chopine" makes 7seas the quantity prefix and "seas" the brand. The correct order is "7 Chopines 7seas" (quantity first, keyword second, brand last).

## 3.3 Brand normalisation and display casing

- Matching uses the lowercased brand, so Coca / coca / COCA are the same key.
- The displayed brand keeps the original case from the most recent adding transaction, so renaming the casing later updates the label.
- Brands starting with digits are reformatted: "7seas" -> "7Seas"; "1l" -> "1L"; "1.5l coca" -> "1.5L coca"; unit-only brands are uppercased to "1L", "1.5L", "2L".
- Accents, typos and word order are NOT normalised: "Biere" vs "Bière", "Coca 1L" vs "1L Coca" create different balances.
- Because size and subtype live inside the brand text, "Bouteille 1L Coca" and "Bouteille 1.5L Coca" are separate lines, as are branded and unbranded bottles.

# 4. How the running balance is calculated

calculateReturnableItemsWithDates() is the single calculator used by the card, the detail modal, the action sheet and the helper popup, so all screens agree.

```
sort transactions oldest -> newest
for each transaction:
  skip if type == "payment"
  skip if description has no chopine/bouteille/caisse
  if description contains "returned" (anywhere):
      for each key already seen: match "N <type>s <brand>" and add to returned
  else:
      parse items, add quantities, remember display brand and newest date
remaining = added - returned   (per key)
show only remaining > 0:  "<remaining> <Type>s [Brand]  (date, time)"
```

## 4.1 Return matching details

| Case | Pattern applied to the text after "returned:" | Consequence |
|---|---|---|
| **Branded key** | (\d+) <type>s? <escaped brand> (case-insensitive) | Brand text must follow the type exactly |
| **Unbranded key** | (\d+) <type>s?(?= *(-\|$)) | Type must be followed by a dash or end of text |
| **No number** | No match | Return is ignored, balance unchanged |
| **Brand typo or different wording** | No match | Return is ignored silently |
| **Unknown item (never added)** | Key does not exist yet | Ignored |

Chronology matters: returns are processed in date order after the debts that created the keys, and multiple return transactions accumulate against the same key.

## 4.2 Display formatting

- Pluralisation applies only to the type: "2 Chopines Beer", "1 Chopine Beer", "3 Bouteilles 1L".
- The card shows the date of the newest adding transaction in DD/MM and flips to the time in HH:MM.
- The detail modal sorts items with Chopine first, then alphabetically by key.
- Items whose remaining quantity is zero or negative disappear from every screen.

# 5. Returning items (removing from the balance)

There is no delete button for returnables. A return is itself a transaction whose description starts with "Returned:", has amount zero, and is stored like any other transaction. This keeps an auditable trail in Items Taken.

## 5.1 Per-item return (client detail modal)

- Long-press a client card to open details; the orange Returnable Items panel lists each key with "Available: N".
- Use the - and + buttons to choose a quantity; the stepper is capped between 0 and the available quantity.
- Press "Return N <item>" to record the return. One transaction is created per item type.
- The success card shows "<N> <item> returned successfully!"; the panel updates immediately.

## 5.2 Clear All

- The Clear All button in the panel header asks for confirmation, then creates one return transaction for the full remaining quantity of every key.
- After processing, a success card is dispatched and the modal closes.
- The confirmation wording mentions Chopine and Bouteille, but the loop processes every outstanding key including Caisse.

## 5.3 Return description format

```
Returned: <qty> <Type plural> [Brand] - DD/MM/YYYY HH:MM

Examples:
  Returned: 2 Bouteilles 1L Coca - 20/10/2026 14:35
  Returned: 1 Chopine Beer - 20/10/2026 14:35
  Returned: 3 Caisses - 21/10/2026 09:02
```

- Only the type is pluralised; the brand is never pluralised.
- For a quantity of one, common French plurals are singularised ("Vins" -> "Vin", also bières, jus, sodas); numeric brands such as 7seas are left untouched.
- The trailing date/time is generated automatically and satisfies the dash requirement of the unbranded match pattern.
- Return transactions keep the client "active" even at zero debt, and they are preserved by an amount-only settlement.

## 5.4 Where else returns can be triggered

ClientActionModal contains the same return formatter (processItemReturn), used by its return/settle flow for a selected item and quantity. It writes the identical "Returned:" transaction, so the calculator treats both screens the same way.

# 6. Payments and settlement: what happens to returnables

| Action | Effect on returnables |
|---|---|
| **Add transaction** | Parsed items add to the balance; debt increases |
| **Partial payment** | Debt decreases; transactions untouched; balance unchanged |
| **Settle (amount only)** | Debt set to 0. Debt transactions are deleted EXCEPT amount-0, "returned", and Chopine/ Bouteille/Caisse descriptions. Returnables are preserved. Adds or replaces the full payment record |
| **Settle with full clear** | Deletes ALL transactions and payments for the client, resets bottlesOwed, records one full payment. Returnables are wiped |

| Action | Effect on returnables |
| --- | --- |
| **Delete client** | Client, transactions and payments removed; balance gone |
| **Delete all clients** | Credit IndexedDB stores cleared |
| **Edit client name/photo** | No effect on returnables |

Practical consequence: settling a client who still holds bottles keeps the orange Returnable Items panel visible because the underlying transactions survive the amount-only settlement.

## 7. Where returnables appear on screen

- Grid card: scrolling line per item plus the newest transaction date/time flip card; zero-debt clients with items remain visible.
- Active filter: a client with zero debt but unreturned items counts as active; the returnables filter tab uses the same calculation.
- Detail modal: Returnable Items panel with per-item steppers, Return buttons and Clear All.
- Items Taken filters: All / Returnable (taken transactions mentioning chopine or bouteille) / Taken (amount > 0, not a return) / Returned (description contains "returned").
- Action sheet and card badges may also show the legacy Bottles owed counters, driven by client.bottlesOwed, not by parsed returnables.

## 8. Edge cases worth reviewing

- A zero-amount debt transaction that mentions a returnable WITHOUT the word "returned" still adds items - useful for swaps, but easy to miscount.
- Different wording or brand spelling creates a separate line instead of adjusting the existing one; the helper popup exists to avoid exactly this.
- Returns written without a quantity, or with a misspelt brand, are silently ignored - no error is shown.
- The Items Taken "Returnable" filter counts only Chopine and Bouteille, while the balance itself also tracks Caisse.
- The per-item Return button label is calculated after the pending quantity is reset, so it can show "Return 0 ..." or a singular label; the recorded transaction and success card use the correct quantity.
- Legacy bottlesOwed is independent of parsed returnables; returning bottles from the detail panel does not decrement those counters, only a full-clear settlement resets them.
- Deleting a transaction (for example during settlement bookkeeping or cleanup) removes its contribution immediately.

# Appendix A. Worked example

Client Kevin Prataub, single client ledger:

| # | Date | Transaction | Amount | Balance after |
|---|---|---|---|---|
| **1** | 14/10/2026 | 1 Caisse, 2 Bouteilles 1L Coca | Rs 335.00 | Caisse 1; Bouteille 1L Coca 2 |
| **2** | 16/10/2026 | Returned: 1 Caisse - 16/10/2026 10:12 | Rs 0.00 | Bouteille 1L Coca 2 |
| **3** | 18/10/2026 | Partial payment | Rs 100.00 | Bouteille 1L Coca 2 (unchanged) |
| **4** | 25/10/2026 | Settle amount only | Rs 235.00 | Bouteille 1L Coca 2 (return transactions preserved) |
| **5** | 27/10/2026 | Returned: 2 Bouteilles 1L Coca - 27/10/2026 17:40 | Rs 0.00 | Panel disappears |

This matches the production behaviour: the balance only ever moves when a qualifying transaction is added, and every screen recomputes it from the same ledger.

# Appendix B. Quick reference

| Question | Answer |
|---|---|
| **Where are returnables stored?** | Nowhere directly - they are derived from credit transaction descriptions at read time |
| **How do I add 2 crates of Coca?** | Add a transaction with description "2 Caisses Coca" (quantity, keyword, brand) |
| **How do I return one?** | Create "Returned: 1 Caisse Coca" - easiest via the detail modal stepper or Clear All |
| **Why did my return not reduce the balance?** | Missing quantity, brand spelling mismatch, unknown item, or the description lacks the word "returned" |
| **Why are two similar bottles listed separately?** | Brand text differs (size, subtype, spelling or word order) - use the helper popup to reuse the exact label |
| **Does settling clear bottles?** | Amount-only settle keeps them; settle with full clear removes everything |
